Overview of this file

This file contains most of the code and data needed to replicate results in Gonzalez-Rostani (2024) “Elections, Right-wing Populism, and Political-Economic Polarization: The Role of Institutions and Political Outsiders.” The structure of the file is based on each one of the files (scripts, do-files, rmd) that can be found in the folder `do`. All of the replication instructions assume that you set the working directory to the same folder as the `Master.rmd` or ‘Master.pdf’ files.

How this file is organized?

- Each section refers to a code file.
- At the beginning the inputs, and outputs are explained.
- Subsections are used to refer to the number/title of the Figure or Table generated.
- This directory contains all the code used in the analysis. The files are categorized based on their relevance to different sections of the study:
 - Files starting with `1_` correspond to analyses related to the **Vote-switching across Institutions** section.
 - Files starting with `2_` pertain to the **Messaging and Targeting Strategies: Candidate Rhetoric and Party Platforms** section, specifically focusing on **Majoritarian Systems** (e.g., US analyses).
 - Files starting with `3_` also relate to the **Messaging and Targeting Strategies** section but focus on **PRITM Systems**.
 - Files starting with `4_` contain code for **Figures that provide context and additional details** but do not directly reflect results.

NOTE: This code does not include files jupyter notebooks:

- `2_0_Speech_US_dictionaries.ipynb`
- `2_3_Speech_US_Germany_Appendix_NMF.ipynb`

Refer to these files directly in the `do` folder.

If you prefer to see each file individually go to the folder `do`.

Motivation Figures [4_1_Figures_ISSP.do]

This do-file:

- Creates Figure 1, 2 and A3 using data from ISSP.

Input:

- Data\Figures_ISSP.dta

Output:

- Figure 1: Relative Share of Labor Force 1995 to 2014 [Figures\Relative Share of Labor Force 1998 to 2014 ISSP.pdf]
- Figure 2: Electoral consequences, Routine and Non-Routine Voters [Figure/price_by_mpg.pdf]
- Figure A3: Importance of job security, Difficulties to find a new job, Concerns about losing the job and Job dissatisfaction [Figure/jobdisatisfactionpredictedtogetherall.pdf]

Table A1: Descriptive statistic: USA GSS 2016 vs 2012

- Input: GSS data
 - Data\Switching\pgen.dta
 - Figure\US.gph this will be used to merge with German.gph (i.e you should run first 1_1_Switching_US.do)

Final output:

- Cleaned data:
 - Data\SOEP.dta this data contains the relevant variables for the analysis.
- Tables:
 - table A4: Switching Vote (Only left) - Germany, IV - RTI [Table\SDU.tex]
 - table A7: Switching Vote From Establishment Left and Right to Populist Right, IV - RTI, German [Table\SOEPlong_2.tex]
 - table A8: Switching Vote, IV - Routine (dummy), Germany [Table\SOEPdummy_2.tex]
 - table A9: Switching Vote (Only from the Right), IV - RTI [Table\CDU.tex]
- Figures:
 - Figure 3: The effect of exposure to automation on vote-switching. [German Part] [Figure/Germany.gph]
 - Figure 3: The effect of exposure to automation on vote-switching. [Merging gph US and German part] [Figure/Graph_US_Germany.pdf]

Messaging and Targeting Strategies: Candidate Rhetoric and Party Platforms

Majoritarian Systems: Messaging and Targeting Strategies in the US

Topic Analysis [2_3_Speech_US_Germany_Appendix_NMF.ipynb]

This file:

- Creates inputs for Table A17: NMF Topic Modeling.
- First it does the NMF for the US, then for Germany.
- Once topic are created the proportion of each one of them is calculated.

Input:

- Data/cleaned_data.csv # Data for the US
- Data/cleaned_data_G.csv # Data for Germany

Output:

- Inputs for Table A17: NMF Topic Modeling, 4 clusters, top-10 terms.

Rallies [2_1_Rally_US.do]

This do-file:

- Creates table A13 using data collected for rallies, visits, and exposure to automation.

Input:

- Data\Rally_Visits_MSA.dta

Output:

- Table 1: Trump's Campaign Strategy (Close election 5) [Table\Trump_high_close5.tex]
- Table A13: Trump's Campaign Strategy (Close election 10) [Table\Trump_high_close10.tex]
- Table A14: Trump's Campaign Strategy (Forecasting 2016) [Table\Trump_high_forec.tex]
- Table A12: Summary statistics of variables used in this study about Trump's campaign strategies: rallies [Table\US_rallies_descriptive.tex]

Campaign Rhetoric Preparing [2_0_Speech_US_dictionaries.ipynb]

This file:

- Creates dictionaries, and applies them to all Trump speeches in the sample.
- These are inputs for the regression analysis conducted in 2_2_Speech_US.do

Input:

- Data/Text/Rallies_MSA.xlsx It is a xlsx file which contains data on the MSA and an identifier to merge with other files for the analysis.
- Data/Text/Presidential... All txt files. From <https://www.presidency.ucsb.edu/>
- Data/Text/Youtube... All txt files. Additional rallies obtained from Youtube.

Output:

- Data/combined_df.csv It is a csv file with the scores per each speech.

NOTE: the code for this file can be accessed in the jupyter notebook in the folder do.

Campaign Rhetoric Analysis [2_2_Speech_US.do]

This do-file:

- Creates Table 2 and A15 using data from Trump Speeches.

Input:

- Data\Text\combined_df.csv // This file contains the data from speeches
- Data\Rally_Visits_MSA.dta // This file contains information about the MSA (e.g, number of exposed workers)
- Alternatively you can go to line 45 and use prepared data:
 - Data\Speech_MSA.dta

Output:

- Table 2: Trump's Campaign Strategy: Speeches [Table\Trump_text_IVchanged.tex]
- Table A15: Trump's Campaigning Strategy: Speeches (Total count) [Table\Trump_text_IVchanged_count.tex]

```

PRITM Systems: Time-Series-Cross-Sectional Evidence on Messaging

CMP main analysis [3_2_CMP_PRITM.do]

This do-file:

- A. Call the Data
- B. Define variables
- C. Export Tables

Input: **Manifesto Project database**

- Data\CMP\MPDataset_MPDS2020a_stata14.dta // Data download from <https://manifesto-project.wzb.eu/datas>

Final output:

- Cleaned data:
 - Data\CMP_main.dta this data contains the relevant variables for the analysis with the DV as the polarization over redistribution, and fixed-value positions, estimated as the distance between establishment left and outsider parties.
- Tables:

- table 3: PRITM: Partisan Polarization over Redistribution and Fixed Attributes [Table\TabWithin.tex]
- table A19: Partisan Polarization over Redistribution and Fixed Attributes Different Cut-Of [Table\TabWithin_cutoff.tex]
- table A20: Alternative measures of Partisan Polarization over Fixed Attributes between Main-stream Left and Right-Populist [Table\TabWithin_FValternative.tex]
- table A18: Descriptive statistic: PRITM 1970-2019 [Table\desc_PRITM.tex]

CMP Appendix - average distance [3_3_CMP_PRITM_Appendix_Average.do]

This do-file:

- A. Call the Data
- B. Define variables
- C. Export Tables

Input: **Manifesto Project database**

```
- 'Data\CMP\MPDataset_MPDS2020a_stata14.dta' // Data download from https://manifesto-project.wzb.eu/data
```

Final output:

- Cleaned data: * Data\CMP_average.dta this data contains the relevant variables for the analysis with the DV as the polarization over redistribution, and fixed-value positions, estimated as the average distance of the party system.
- Tables: * table A21: Partisan Polarization over Redistribution and Fixed Attributes

```

PRITM Systems: Campaign Message and Targeting Strategies in Germany

Topic Analysis [2_3_Speech_US_Germany_Appendix_NMF.ipynb]

This file:

- Creates inputs for Table A17: NMF Topic Modeling.
- First it does the NMF for the US, then for Germany.

Table A23: Partisan Polarization over Redistribution and Fixed Attributes

	(1)	(2)
	Redistribution	Fixed Values
High LMP period	-3.3e+03 (1.3e+04)	1.1e+04*** (3248.358)
Control variables	Yes	Yes
LDV	Yes	Yes
Observations	180	180
R ²	0.326	0.295
AIC	4589.552	4358.513

Standard errors in parentheses

* $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$

- Once topic are created the proportion of each one of them is calculated.

Input:

- Data/cleaned_data.csv # Data for the US
- Data/cleaned_data_G.csv # Data for Germany

Output:

- Inputs for Table A17: NMF Topic Modeling, 4 clusters, top-10 terms.

NOTE: the code for this file can be accessed in the jupyter notebook in the folder do.

Targeting Strategies: Electoral Performance Across Districts [[3_0_Regional_Germany_HateIncidents.rmd](#)] & [[3_1_Regional_Germany.do](#)]

[[3_0_Regional_Germany_HateIncidents.rmd](#)] This Rmarkdown:

- Creates a file with the data for hate incidents by region in Germany.

Input:

- Download arvig data from the package

Output:

- Data/final_aggregated_data.dta It is a dta file with the count of hate incidents per geographic area.

```
# install.packages("devtools")
devtools::install_github("davben/arvig")
```

```
library(arvig)
library(tidyverse)
library(sf)

data("arvig")
```

```

## Preparing the data
#I will count the events, and create a single variable called anti, which refers to the count of incidents

data(arvig, package = "arvig")
arvig$count<-1
arvig <- arvig %>%
  mutate(attack = case_when(
    category_en %in% c("arson & miscellaneous attack",
                      "demonstration & miscellaneous attack",
                      "assault",
                      "miscellaneous attack",
                      "miscellaneous attack & assault",
                      "arson",
                      "other") ~ 1,
    TRUE ~ 0 # Assigns 0 if none of the conditions above are met
  ))

arvig <- arvig %>%
  mutate(demonstration = case_when(
    category_en %in% c("demonstration",
                      "demonstration & miscellaneous attack",
                      "suspicion") ~ 1,
    TRUE ~ 0 # Assigns 0 if none of the conditions above are met
  ))

```

Common format to merge

To merge the data with the other sources I need to modify community_id and call it kreis.

```

arvig$kreis <- ifelse(substr(arvig$community_id, 1, 1) == "0",
                    substr(arvig$community_id, 2, 5),
                    substr(arvig$community_id, 1, 5))

```

```

arvig$new_column <- as.numeric(substr(arvig$community_id, 1, 5))
# Check data types for specific columns
sapply(arvig[c("kreis", "count", "attack", "demonstration")], class)

```

	kreis	count	attack	demonstration
	"character"	"numeric"	"numeric"	"numeric"

```

# Ensure we're working with the correct data types
arvig$kreis <- as.numeric(arvig$kreis)
arvig$anti <- as.numeric(arvig$count)

arvig$kreis[arvig$kreis == 3159] <- 3158
arvig$kreis[arvig$kreis == 11000] <- 11100
arvig$state_state<-arvig$state

```

Subsetting for the period of interest 1 year previous to the election

```

# Ensure that the 'date' column is in Date format
arvig$date <- as.Date(arvig$date)

```

```
subset_arvig <- subset(arvig, date >= as.Date("2016-09-01") & date <= as.Date("2017-10-01") )
```

Collapsing by geographic unit

Since the data is a list of events I am aggregating it so I can have an indicator per region.

```
# Aggregating numeric variables
agg_data <- aggregate(cbind(anti, attack, demonstration) ~ kreis, data = subset_arvig, sum, na.rm = TRUE)

arvig_sorted <- subset_arvig[order(subset_arvig$kreis), ]
first_instances <- arvig_sorted[!duplicated(arvig_sorted$kreis), c("kreis", "community_id", "longitude")]

# Merging aggregated numeric data with first instances of other variables

final_aggregated_data <- merge(agg_data, first_instances, by = "kreis")

# Replace specific 'kreis' values
```

Saving the data I will use to merge with others sources

```
# Get the directory of the current Rmd file
#current_dir <- dirname(rstudioapi::getActiveDocumentContext())$path

# Define the path to the "Publication" folder
#publication_folder <- normalizePath(file.path(current_dir, ".."))

# Set the working directory to the "Publication" folder
#setwd(publication_folder)

# Verify the working directory has been set correctly
#print(getwd())

# Load the haven package
library(haven)

# Use write_dta to save the dataframe as a .dta file
write_dta(final_aggregated_data, "Data/Region_Germany/final_aggregated_data.dta")
```

[3_1_Regional_Germany.do] This do-file:

- Creates Table 4 and A16 using data from electoral performance of the AfD, hate incidents, and exposure to automation.

Input:

- Data\Region_Germany\btw2017kreis (3).csv // This file contains electoral results.
- Data\Region_Germany\ RegionEntries14.dta // This file contains replication data from “Trade and Manufacturing Jobs in Germany” By Wolfgang Dauth, Sebastian Findeisen, and Jens Suedekum

- Data\Region_Germany\final_aggregated_data.dta // This file contains hate incidents in Germany, subset prepared from ARVIG data. The rmd which creates this file is named as 3_0_Regional_Germany_HateIncidents.rmd

Alternatively you can go to line 79 and use prepared data: - Data\Regional_Germany.dta

Output:

- Table 4: AfD Performance [Table\AfD_high_pop_r2.tex]
- Table A16: Summary statistics of variables used in this study about AfD regional performance [Table\AfD_descriptive.tex]
